

Proof: (i) if  $S$  is linearly independent then  $S$  is contained in a basis of  $n$  vectors, hence  $|S| \leq n$ .

(ii) if  $S$  spans  $V$  then  $S$  contains a basis of  $n$  vectors, hence  $|S| \geq n$ .  $\square$

Corollary: Let  $\dim V = n$  and let  $S$  be a set of exactly  $n$  vectors.

(i) if  $S$  spans  $V$  then  $S$  is a basis for  $V$ .

(ii) if  $S$  is linearly independent, then  $S$  is a basis for  $V$ .

That is, if  $\dim V = n = |S|$ , then  $S$  spans  $V$  if and only if  $S$  is linearly independent.

Proof: (i) If  $S$  spans  $V$  then  $S$  contains a basis  $B$  for  $V$ .

But  $|B| = n = |S|$ , hence  $S = B$ .

(ii) if  $S$  is linearly independent, then  $S$  is contained in a basis  $B$  for  $V$ , and  $|B| = n = |S|$ . Hence  $S = B$ .  $\square$

Theorem: Let  $W$  be a subspace of  $V$ . If  $B_W$  is a basis for  $W$ , then there is a basis  $B_V$  for  $V$  containing  $B_W$ .

Proof: A basis  $B_W$  for  $W$  is a linearly independent subset of  $V$ , so is contained in a basis  $B_V$  for  $V$ .  $\square$

Corollary: Let  $V$  be a finite dimensional vector space,  $W$  a subspace of  $V$ . Then  $\dim W \leq \dim V$ , and  $\dim W = \dim V$  if and only if  $W = V$ .

Proof: The first statement is immediate from the theorem.

For the second, let  $B_W$  be a basis for  $W$  and  $B_V$  a basis for  $V$  containing  $B_W$ , so  $|B_W| = \dim W \leq \dim V = |B_V|$ .

Thus  $\dim V = \dim W$  if and only if  $B_W = B_V$ , and so if and only if  $W = \text{sp}(B_W) = \text{sp}(B_V) = V$ .  $\square$

Note: The second statement in the corollary is false if  $V$  is infinite dimensional.
